Subject
Remarks w.r.t. the mdu-file

1 Remarks

List of some remarks

1 Some keywords starts with invalid characters, such as numbers. Detected examples `1D2DLink` en `3Dtype`. These two keywords are changed by the python script to `Link1D2D` and `Type3D`

2 The missing value `-999.999` in pli-files are skipped in the *multiLine*-environment. **This can lead to unexpected concatenation when this missing value was used as separator in the *.pli file**. If one coordinate is left then the *multiLine*-environment is changed into a *multiPoint*-environment.

3 Spaces in filenames are not allowed, because the separator between two files is a space

4 Spaces in the key of 'program', 'nodeid' and 'branchid' are allowed, and treated in a special way because a space is used as seperator in a filename list
